Executive Summary

The Azure SRE Agent assessment reviewed production reliability, observability, operational readiness, and remediation planning across critical Azure resources. The generated report uses free-flowing pages with proper indentation and a navigable table of contents.

Key Findings

Finding ID	Category	Severity	Resource	Observation	Impact	Recommendation	Status
F-001	Reliability	High	Azure SQL Database	CPU utilization exceeded threshold during peak cycle.	Potential performance degradation.	Review autoscaling and SKU right-sizing.	Open
F-002	Monitoring	Medium	Azure Monitor	Alert routing does not include all primary responders.	Delayed incident response.	Update action groups and escalation paths.	In Progress

Table 1: Sample reliability findings.

Recommendations

- Enable consistent alert routing for all production workloads.
- Review autoscaling policies for high-usage resources.
- Include human approval evidence before any remediation execution.
- Track remediation progress using a centralized operational dashboard.

Approval Status

Remediation actions in this report are recommendations only. No remediation execution should occur without approved change evidence and explicit human-in-the-loop authorization.
